

2006 REGISTRATIONS

The Registration process is only as good as the people who register their plants, and the quality of the information that they provide. I want to thank all who have taken the time to make this an informative and educational effort. There are 133 new registrations for 2006. There are now a total of 3648 registered hostas. As the comprehensive index has become longer than the yearly registrations we are moving to publish the index every third year. You are reminded that last year's comprehensive index includes all but this year's registrations, we will also maintain a complete index on the Registrar's Web site between hardcopy versions. Under the *International Code of Nomenclature for Cultivated Plants* (ICNCP), registrations are established when printed in a publication that reaches the general public. Thus, although these, and other names may appear elsewhere, especially if found in electronic media, they may not be established. (See also, **Plant Patents, Plant Breeder's Rights and Establishment** below.)

The simplified registration form (included at the end of this publication) was introduced in June of 1998. Part of the simplification was to give registrants the option to place their cultivar in a more general category rather than give the specific dimensions. These categories (miniature, small, med., large, and giant) are somewhat arbitrary. Thus, if possible, please provide actual measurements as this will prove more informative to those who read these pages. Please try to provide as much information as possible.

Under parentage information (found within the brackets at the end of each cultivar entry) the category of "parentage unknown" was added in 1997. As is consistent with the registrar's policy of attempting to provide the most informative descriptions, I considered adding a category this year. I did not, but request registrant's be more informative in the future where the parentage information submitted provides no guidance as to the parentage, such as [seedling × seedling] or [sport of stabilized seedling of unknown parents]. This does not imply anything regarding the validity of information submitted by the registrant, only that the description as registered adds nothing to the genetic, or parentage knowledge base. Parentage information published with registrations is intended to be "known parentage" as opposed to guesses, educated or otherwise. The abbreviation "TC" is used to indicate "tissue culture."

In reviewing this year's submissions, I have become conscious that one of the more confusing sections to fill out is regarding the "origin" of the cultivar being registered. Many persons who have listed themselves as the originator, are also indicating that the seedling or sport that was used for measurement purposes to complete the registration was obtained from the originator. If you are the originator you did not obtain the plant from anyone, or you are not the originator. On the other hand if you have received the sport from TC and the plant being TCed was not yours, then you may not be the originator. Think this section through when filling out the form, simple logic should help you with the answer. Please, if you have any questions regarding any part of the form do not hesitate to e-mail me with your questions.

In registering hostas, classifying them for Hosta Shows and for those entering and judging them, I am finding that there are several problems with the determination of the margin colors, as well as the base color descriptions, that are submitted by the person registering the hosta, especially if the registrant is looking at yellowish green, greenish yellow, creamy yellow, or other similar compound color descriptions. To elaborate: 1) registrants most often have no reference chart to consult (i.e., what is the difference between greenish yellow and yellowish green) and 2) the margin color may change rather rapidly and it depends at what time they make their observations. If the greenish is very early and lasts only a couple of weeks, then turns to cream, then we should register it as white, if it turns to yellow, then yellow, or if to chartreuse, then green. In an effort to ease this dilemma, we will be providing at the Registrar's Web site a series of sample charts (coming soon), with codes to assess the accuracy of other codes, or of your computer/printer color indicators and to improve your registration information. More detailed RGB or Hex # color charts may be found at various Web sites, or by ordering the Royal Horticultural Society Colour Chart.

Brief Key to Descriptions: **ONIR:** O=originator, N=nominant (namer), I=introducer, R=registrant.

Flowers: Bloom periods are given in either start - peak - finish format or a more general period format. The general periods are as follows: Very early period: before June 1, average period: June 1 - July 15, summer period: July 15 to August 15, late period: August 15 to October 1, very late period: after October 1;

Bloom Period Codes: Ties the flowering of the cultivar to a "species scale". The registrant has provided the number code from the scale below for the start - peak - finish of the flowering period.

2006 REGISTRATIONS

Plant Patents, Plant Breeder's Rights and Establishment: Principle 5 of the ICNCP states:

"This *Code* regulates the terminology to be used for distinguishable group of plants in cultivation and the names to be applied to individual distinguishable groups."

"Under some national and international legislation such as that providing for National Listing or Plant Breeders' Rights (Plant Variety Rights), names may be established for distinguishable groups of plants using terminology peculiar to such legislation. This *Code* does not regulate the use of such terminology or the formation of such names but recognizes that, under such legislation, these names take precedence over names formed under the provisions of this *Code*."

Article 28.2 of the *Code*: "the name of a cultivar accepted and published by a statutory plant registration authority, even if using alternative terminology must not be rejected under the provisions of this *Code*."

In keeping with this principle, included on page 21 is a table of hostas that have been processed under one of these pieces of legislation. The table also indicates which have already been registered. Those which have not been registered have been established and thus, those names although, not registered, are not available for use by any other person. Of note, of the 59 cultivars granted these other protections, 47 are already registered, thus most still feel the registration process is as valuable as the legal protections afforded by certain jurisdictions.

Thanks: The editing of W. George Schmid, Mark Zilis, C.H. Falstad, III and Warren Pollock is acknowledged and greatly appreciated.
